The 23-kilodalton protein, a substrate of protein kinase C, in neutrophil cytosol is a member of the S100 family.";
Biochemistry 31:5898-5905(1992).
-!- SUBUNIT: Disulfide linked heterodimer of a 7/11 kDa and a kDa subunits.
-!- SUBCELLULAR LOCATION: Cytoplasmic; loosely associated to the cytoskeleton.
-!- SUBCELLULAR LOCATION: Cytoplasmic; loosely associated to the cytoskeleton.
-!- TISSUE SPECIFICITY: Found essentially in phagocytic cells.
-!- FTM: Phdsphorylated by protein kinase C.
-!- PTM: Phdsphorylated by protein kinase C.
-!- SIMILARITY: Belongs to the S-100 family.
-!- SIMILARITY: Contains 2 EF-hand calcium-binding domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CabP_S100; 1.

Miyasaki K.T., Bodeau A.L., Murthy A.R., Lehrer R.I.;
In vitro antimicrobial activity of the human neutrophil cytosolic S-
100 protein complex, calprotectin, against Capnocytophaga sputigena.";
J. Dent. Res. 72:517-523(1993).
-!- FUNCTION: Expressed by macrophages in acutely inflammated tissues and in chronic inflammations. Seem to be an inhibitor of protein kinases. Also expressed in epithelial cells constitutively or induced during dermatoses. May interact with components of the intermediate filaments in monocytes and epithelial cells.
-!- MISCELLANEOUS: Has been shown to bind calcium.
-!- SIMILARITY: Belongs to the S-100 family.
-!- SIMILARITY: Contains 2 EF-hand calcium-binding domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                               EF-hand 1; low affinity (Potential).

EF-hand 2; high affinity (Potential).

Phosphothreonine.

Interacts with S100Z.
MISCELLANEOUS: This protein binds two calcium ions.
SIMILARITY: Belongs to the S-100 family.
SIMILARITY: Contains 2 EF-hand calcium-binding domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                the

                                                                                                                                                                                                                                                                                                                                                                                               120
                                               This sequence represents the CAAFI calcium-binding protein isolated from human amniotic fluid. CAAFI belongs to the $100 protein family, which includes calcyclin, MRPB, and MRP14. Intracellular calcium ion concentration is one of the key factors for intracellular signal transduction. The calcium signals are transduced by various calcium-binding proteins, such as this protein. CAAFI is normally expressed in squamous epithelial cells, neutrophils and macrophages, but atypical epithelial cells are negative for CAAFI and overexpression is observed in several types of cancer cells and neutrophils/macrophages infiltrating cancerous lesions. Detection of CAAFI (using antibodies in usual immunoassays) can be used to diagnose (or monitor) inflammation, neoplasia (particularly squamous cell carcinoma of the skin, oesophagus, lung and cervix), and skin and blood diseases

This is a human chemotactic cytokine I polypeptide. The encoding polynucleotide, along with a vector and a host cell can be used for the recombinant production of the chemotactic cytokine. Cytokine agonists and antagonists can be used for the treatment of a patient requiring a chemotactic cytokine I and for the treatment of a patient requiring the inhibition of a chemotactic cytokine I polypeptide, respectively. The chemotactic cytokine is used to treat tumours, chronic infection, leukaemia and T-cell mediated autoimmune diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        240

This invention describes a novel composition for treating primary or secondary cardiomyopathy or cardiac insufficiency contains at least one Secondary cardiomyopathy or cardiac insufficiency contains at least one SIOO protein (I) or nucleic acid (II) encoding (I), or their mutants or fragments, or a gene transfer vector containing (II), optionally formulated with auxiliaries and/or carriers. (I) are calcium-binding proteins involved in calcium homeostasis, so their overexpression in cardiac muscle will improve pumping capacity (and overall capacity) of the heart. In cultured myocardial cells they increase the contraction and relaxation rates associated with increased systolic calcium ion release from the sarcoplasmic reticulum (SR) and calcium re-uptake by SR. (I) are used to treat caudiomyopathy (CMP) where inherited or caused by spontaneous mutations and ischemic CMP caused by arteriosclerosis, dilative CMP caused by toxic/infectious disease, cardiac disease caused by rhythm disorders or valve defects, generally any condition associated with reduced contractile force. Unlike calmodulin, which is expressed ubiquitously, (I) show tissue-specific expression and treat the underlying defect in the sarcoplasmic reticulum (SR) that causes cardiac underlying defect in the sarcoplasmic reticulum (SR) that causes
                                                                                                                                                                                                                                                                                                      protein, corresponding nucleic acid or cardiomyopathy and cardiac insufficiency

Detecting, preventing and treating degenerative, neurological and autoimmune diseases, particularly multiple sclerosis, using specified polypeptides or related nucleic acid or ligand.

Claim 1; Page 168; 209pp; French

The present sequence represents a human protein, which is used in the method of the invention. The specification describes a method which uses at least one polypeptide or polynucleotide sequence belonging to the perlecan, precursor of the retinol-binding plasma protein, precursor of the ganglioside GM2 activator, calgranulin B or saposin B protein the ganglioside GM2 activator, calgranulin B or saposin B protein families. The method is used for detecting, preventing or treating a degenerative, neurological and/or auto-immune disease. The polynucleotides and polypeptides are used for diagnosis, prognosis, prevention and treatment of multiple sclerosis (in its various forms and plases). They may also be useful in cases of e.g. Alzheimer's and polypeptides are used for diagnosis, rheumatoid parkinson's diseases, amyotrophic lateral sclerosis, rheumatoid polyarthritis and lupus erythematosus, including use as vaccines and in gene therapy (expression of sense or antisense sequences). They can also be used to assess efficacy of potential therapeutic agents, particularly compounds that reduce or inhibit toxicity towards glial cells

The present sequence represents a human protein, which is used in the method of the invention. The specification describes a method which uses at least one polypeptide or polynucleotide sequence belonging to the perlecan, precursor of the retinol-binding plasma protein, precursor of the ganglioside GM2 activator, calgranulin B or saposin B protein families. The method is used for detecting, preventing or treating a degenerative, neurological and/or auto-immune disease. The polynucleotides and polypeptides are used for diagnosis, prognosis, prognosis, prevention and treatment of multiple sclerosis (in its various forms and phases). They may also be useful in cases of e.g. Alzheimer's and Parkinson's diseases, amyotrophic lateral sclerosis, rheumatoid

The present invention describes a method for diagnosing inflammatory diseases, which comprises determining the amount and/or concentration of calgranulin C polypeptide and/or nucleic acids encoding the polypeptide present in the biological sample. Also described are methods for treating or preventing an inflammatory disease in a mammal, and medical treatment of the mammal, where the treatment is based on the stage of the disease to be treated or prevented. Calgranulin C has antiinflammatory activity and can be used in gene therapy. The method is useful for diagnosing, treating or preventing inflammatory disease, e.g. vasculitis of particularly Kawasaki disease), cystic fibrosis, chronic inflammatory disease, like ulcerative colitis or Crohn's disease, chronic bronchitis, inflammatory arthritis (sor seronegative arthritis), systemic onset juvenile rheumatoid arthritis or seronegative arthritis), systemic onset juvenile rheumatoid arthritis (SoJRA or Still's disease), acute inflammation above the background of an chronic inflammatory disease, or an exacerbation of an already present disease. The method is also useful for diagnosing specific stages of inflammatory diseases, for determining the risk of relapse, and for discriminating between diseases with similar symptoms. The present sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 40

The invention relates to novel polynucleotide and polypeptides for treating psoriasis or a sequence having at least 80% identity to the above sequences. The nucleic acid is useful for preparing a composition for diagnosing or treating psoriasis in a mammal. This sequence corresponds to one of the polypeptides of the invention.

120 Human; PRO; immune related disorder; systemic lupus erythematosus; rheumatoid arthritis; osteoarthritis; juvenile chronic arthritis; systemic sclerosis; Sjogren's syndrome; vasculitis; sarcoidosis; autoimmune haemolytic anaemia; autoimmune thrombocytopenia; thyroiditis; diabetes mellitus; renal disease; demyelinating disease; central nervous system; peripheral nervous system; demyelinating polyneuropathy; Guillain-Barre syndrome; chronic inflammatory demyelinating polyneuropathy. Novel PRO polypeptide e.g., PRO69614, PRO71106, or PRO86388 useful for treating an immune related disorder such as systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, juvenile chronic arthritis or spondyloarthropathy. 20 The invention relates to human PRO polypeptides and the polynucleotides encoding them. The polypeptides and polynucleotides are useful for treating and diagnosing immune related disorders in mammals. The immune related disorders include systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, juvenile chronic arthritis, systemic sclerosis, Sjogren's syndrome, vasculitis, sarcoidosis, autoimmune haemolytic anaemia, autoimmune thrombocytopenia, thyroiditis, diabetes mellitus, immune-mediated renal disease, demyelinating diseases of the central or peripheral nervous system, demyelinating polyneuropathy, Guillain-Barre syndrome and chronic inflammatory demyelinating polyneuropathy. This sequence represents a human PRO polypeptide of the CGGAAGGGGCATTTTGACACCCTCTCTAAGGGTGAGCTGAAGCAGCTGCTTACAAAGGAG CTGGAGGAATTGTCAATATCTTCCACCAATACTCAGTT Williams Schoenfeld J, 00000 Length:

This invention relates to the novel association of protein sequences (and the genes which encode them) to the NF-kappaB pathway. The invention may be useful for the production of compounds with an antiinflammatory, cytostatic, hepatotropic, virucide, antiarthritic, antirheumatic, antiarthritic, antinheumatic, cytostatic, hepatotropic, virucide, antiarthritic, antirheumatic, antiarthritic, antinheumatic, antiarthritic, antirheumatic, cytostatic, hepatotropic, virucide, antiarthritic, antirheumatic, antiarthritic, antirheumatic, antiarthritic, antirheumatic, cameliorating corditions or useful for diagnosing, preventing, treating, or ameliorating conditions or diseases associated with the NF-kappaB pathway. The condition is an immune disorder, an inflammatory disorder, an inflammatory disorder, an inflammatory disorder, aberrant apoptosis, hyper-Igm syndromes, hypohidrotic ectodermal dysplasia, x-linked anhidrotic ectodermal dysplasia, immunodeficiency, viral infections, HIV-1, HTLV-1, hepatitis B, hepatitis C, EBV, influenza, viral replication, host cell
                                                                                                                                                                                                                                                                                                                          WF-kappaB pathway; antiinflammatory; cytostatic; hepatotropic; virucide; antiarthritic; antirheumatic; gastrointestinal-Gen; antiasthmatic; antiarthritic; antirheumatic; gastrointestinal-Gen; antiasthmatic; antiarteriosclerotic; immunomodulator; cerebroprotective; vasotropic; immunosuppressive; vulnerary; gene therapy; immune disorder; immunosuppressive; vulnerary; gene therapy; immune disorder; hepatic disorder; NF-kappaB regulation; cancer; aberrant apoptosis; whyper-IgM syndrome; hypohidrotic ectodermal dysplasia; immunodeficiency; W hyper-IgM syndrome; hypohidrotic ectodermal dysplasia; immunodeficiency; wiral infection; HIV-1; HTLV-1; hepatitis B; hepatitis C; EBV; influenza; wiral replication; host cell survival; evasion of immune response; wherosclerosis; cachexia; euthyroid sick syndrome; stroke; EAE; authorimmune disorder; hyper immune activity; autoimmune disorder; hyper immune activity; aberrant acute phase response; hypercongenital condition; birth defect; meroric lesion; wound; organ transplant rejection; unit signal transduction; proliferating disorder; cancer; unit signal transduction; proliferating disorder; cancer;

```
burylval, evaluation of immune responses, incumarcial architers, intrammatory bowel disease, colitis, asthma, atherosclerosis, cachexia, euthyroid sick syndrome, stroke, EAE, autoimmune disorders, disorders related to hyper immune activity, disorders related to aberrant acute phase responses, hypercongenital conditions, birth defects, necrotic lesions, wounds, organ transplant rejection, conditions related to organ transplant rejection, disorders related to aberrant signal transduction, proliferating disorders, cancers and HIV propagation in cells infected with other viruses. The present sequence is that of a human protein which is subject to the novel association with the NF-kappaB pathway of the invention. Note: This sequence does not appear in the specification but was obtained by the indexer from Genbank.

New PRO polypepticerythematosus, rhorenal disease, or WPI; 2004-419628/ N-PSDB; ADP23920 

39

des and polynucleotides, useful for treating e.g. eumatoid arthritis, diabetes mellitus, immune-mediated demyelinating diseases of the central or peripheral nervous system.

NO 1099; 2940pp; English ΩĦ SEQ Claim 7;

The invention relates to a novel isolated nucleic acid and the PRO polypeptide encoded by it. A protein of the invention has antiarthritic, antirheumatic, immunosuppressive, contininglammatory, antiarthritic, antirheumatic, immunosuppressive, costeopathic, antidiabetic, and respiratory activity. A polymuclectide cof the invention may have a use in gene therapy. The PRO polypeptide, its agonist, antagonist, or antibody that specifically binds to the polypeptide is useful for treating an immune related disorder such as cystemic lupus erythemators, rheumatorid arthritis, osteoarthritis, invenile chronic arthritis, a spondyloarthropathy, systemic sclerosis, andiopathic inflammatory myopathhy, Sjoarch systemic sclerosis, andiopathic inflammatory myopathhy, Sjoarch systemic ademyelinating disease of the central or peripheral nervous cystem, idiopathic demyelinating polyneuropathy, duilain-Barre syndrome, a chronic inflammatory demyelinating polyneuropathy, duilain-Barre syndrome, contropic inflammatory bowel disease, duten-sensitive enteropathy, Muhiple's inflammatory bowel disease, gluten-sensitive enteropathy, Muhiple's disease, asthma, allergic rhinitis, atopic dermatitis, psoriasis, an allergic chisease, asthma, allergic rhinitis, atopic dermatitis, food hypersensitivity, urticaria, an immunologic disease, bypersensitivity pneumonia, idiopathic pulmonary findermentis, a transplantation associated disease, spreamer and encompassion or content dermatitis, at ransplantation associated disease, graft rejection or graft-versus-host disease. The present sequence represents a PRO protein or graft-versus-host disease.

New nucleic acid encoding PRO polypeptide, useful for diagnosing and treating psoriasis, Crohn's disease, Ulcerative Colitis, or rheumatoid arthritis.

50; 166pp; English õ Claim 9; SEQ ID The present sequence is the protein sequence of novel human PRO polypeptide PRO62943. The invention provides newly identified and isolated nucleotide sequences encoding polypeptides referred to as PRO polypeptides that are useful in the diagnosis and treatment of immune-clated diseases. Microarray analysis showed that expression of PRO62943 is up-regulated 4-fold in lesional skin as compared to non-lesional skin is up-regulated 4-fold in lesional skin as compared to those from healthy donors. The macrophages arthritis patients as compared to those from healthy donors. It is also down-regulated 2-fold upon activation of CD4 T cells with CD28 or ICAM, down-regulated 6-fold upon differentiation of monocytes into macrophages after 7 days in differentiation media and up-regulated 4-fold upon activation of identifying a compound that inhibits expression of the gene encoding it. The candidate compound is especially an antisense nucleic acid. The PRO polypeptide can be obtained by recombinant expression, especially in CHO, Escherichia coli or yeast host cells. The polypeptide, its antagonist or an antibody that binds the polypeptide are used in claimed methods for the alleviation or diagnosis of rheumatoid arthritis and psoriasis.

```
The present sequence represents a human protein, which is used in the method of the invention. The specification describes a method which uses at least one polypeptide or polynucleotide sequence belonging to the perlecan, precursor of the retinol-binding plasma protein, precursor of the sanglioside GM2 activator, calgranulin B or saposin B protein the ganglioside GM2 activator, calgranulin B or saposin B protein and is used for detecting, preventing or treating a degenerative, neurological and/or auto-immune disease. The polynucleotides and polypeptides are used for diagnosis, prognosis, prevention and treatment of multiple sclerosis (in its various forms and phases). They may also be useful in cases of e.g. Alzheimer's and Parkinson's diseases, amyotrophic lateral sclerosis, rheumatoid polyarthritis and lupus erythematosus, including use as vaccines and in gene therapy (expression of sense or antisense sequences). They can also be used to assess efficacy of potential therapeutic agents, particularly compounds that reduce or inhibit toxicity towards glial cells
                                                                                                          180
                                                                                                                                                                    240

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping,

and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful in to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical imaging of supplement. (II) and its binding partners are useful in medical imaging of supplement. (II) and its binding partners are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders in polypeptide and polynucleotide sequences have applications in the produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the invention of the content of the directly from WIPO at the content of the content
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  120

A novel bioactive metal RNA polypeptide (RNP) has a RNA component having the including the sequence AAT62568 and a polypeptide component having the sequence AAM01826, which is encoded by AAT62569. The RNP, or anti-RNP immunoglobulins, can be used to modulate and/or analyse angiogenesis and the vascular state of mammalian tissue, transfer genetic information in cells and selectively alter the nucleic acid content of cells. Leukocytes from pig's blood were cultured in medium, and the supernatant treated with NH4 sulphate at 35, 45 and 90% saturation to precipitate protein fractions. The residual supernatant was diltued to 45% NH4 sulphate saturation and concentrated by ultrafiltration using a 0.5 kD membrane. The retenate was purified to give 8 mg of product described as monocyto-CuRNP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      124 GCAAACACCATCAAGAATATCAAAGATAAAGCTGTCATTGATGAAATATTCCAAGGCCTG

SEQUENCE 2, Application US/10077600

SEQUENCE 2, Application No. US20030175713A1

GENERAL INFORMATION:

APPLICANT: Switch Biotech AG

TITLE OF INVENTION: Method for diagnosis of inflammatory diseases using Calgranulin of TILE REFERENCE: S30274US

FILE REFERENCE: S30274US

CURRENT APPLICATION NUMBER: US/10/077,600

CURRENT FILING DATE: 2002-06-14

NUMBER OF SEQ ID NOS: 2

SOFTWARE: Patentin version 3.1

SEQ ID NO 2

LENGTH: 92

TYPE: PRT

ORGANISM: homo sapiens

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                       US-09-910-208B-12

GENERAL INFORMATION:
APPLICANT: HITOMI, JIRO
APPLICANT: YAMAGUCHI, KEN
APPLICANT: YAMAGUCHI, KEN
APPLICANT: KAMAGUCHI, KEN
APPLICANT: KAMAGURA, TATSUJI

TITLE OF INVENTION: NOVEL CALCIUM-BINDING PROTI
NUMBER OF SEQUENCES:
ADDRESSE: WYAT, GERBER, MELLER & O'ROURKE
STREET: 99 PARK AVENUE
STREET: OF INVENTION: NOVE
CITY: NEW YORK
COUNTRY: USA
ZIP: 10016

COMPUTER READABLE FORM:
MEDIUM TYPE: STORAGE
COMPUTER: IBM-PC COMPATIBLE
OPERATING SYSTEM: PC-DOS 6.2
SOFTWARE: WORDERFECT 6.1
CURRENT APPLICATION NUMBER: US/09/270,455
FILING DATE:
APPLICATION NUMBER: US/09/270,455
FILING DATE:
ATTORNEY AREATION NUMBER: 27101
REFERENCE/DOCKET NUMBER: 3316

Patent No. 6670136
GENERAL INFORMATION:
APPLICANT: Schmidt, Ann Marie
APPLICANT: Stern, David
TITLE OF INVENTION: EXTRACELLULAR NOVEL RAGE BINDING PROTEIN (EN-RAGE) AND USES THERFILE REFERENCE: 0575/55873-B-PCT-US
CURRENT APPLICATION NUMBER: US/09/826,589
CURRENT FILING DATE: 2001-04-05
NUMBER OF SEQ ID NOS: 6
SOFTWARE: Patentin version 3.1
SEQ ID NO 4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       RESULT 10

Sequence 4, Application US/09806382A

Patent No. 6706683

GENERAL INFORMATION:

APPLICANT: SETO, MINORU

APPLICANT: FUKUDA, KOUICHIROU

TITLE OF INVENTION: METHOD OF CONTROLLING SECRETION OF GRANULES

FILE REFERENCE: ASAHI-3-PC-1

CURRENT APPLICATION NUMBER: US/09/806,382A

CURRENT FILING DATE: 2001-03-29

PRIOR APPLICATION NUMBER: PCT/JP99/05302

PRIOR FILING DATE: 1999-09-28

PRIOR FILING DATE: 1999-09-28

NUMBER OF SEQ ID NOS: 4

SOFTWARE: Patentin Ver. 2.1

SEQ ID NO 4

LENGTH: 114

TYPE: PRT

ORGANISM: Homo sapiens

probable membrane protein YPR170c - yeast (Saccharomyces cerevisiae)
C;Species: Saccharomyces cerevisiae
C;Species: Saccharomyces cerevisiae
C;Date: 22-Nov-1996 #sequence_revision 22-Nov-1996 #text_change 26-Aug-1999
C;Accession: S69743; S69742
R;Pauley, A.
submitted to the EMBL Data Library, April 1995
